

## **It is vital for graziers to maintain healthy livestock production during times of drought**

Graziers face many challenges about sustainable livestock production. A contentious issue is how to enhance farming, without further degrading stressed forage ecosystems due to low irregular rainfall across large areas of pastoral range land.

PFMA understands that income and a healthy flock for reproduction must be maintained for producers. The question we seek to answer is: how to achieve this within the bounds of today's economic reality and variable climate?

We found the answer lies in new technologies and available science. By utilising up to date feed science, combined with an understanding of both livestock requirements and demands placed on graziers in servicing very large areas of country, PFMA have developed products that address these issues while maintaining the integrity of the land.

We understand these challenges and know how to meet them head on in the interim until substantial rainfall reoccurs renewing and regenerating edible forage.

During drought, lower quality nutrient intake causes sheep to mobilise minerals and energy from their bone structure and muscle. This results in loss of body condition and stamina, decreases livestock production and affects future reproduction. Our correct nutrient supplementation will remedy this problem.

We have formulated **PFMA Plus SH – PRL600**, an advanced feed science complex all weather loose nutrient mix specifically for sheep grazing under drought conditions. The products concentration, with a density of 99.5% (dry matter) ensures feeding out is easy and manageable over large areas; with every gram of dietary intake contributing substantially to livestock health and condition.

This advanced mix will replenish depleted, stored, bone mineral levels while the energy and essential vitamins and micro minerals will be restored into the animal's body tissue and muscle at levels required for good health.

- Contains performing levels of calcium, phosphorous, magnesium, sulphur, zinc, manganese, copper, cobalt, iodine & selenium
- With vitamins A, D3 and E
- Plus advanced energy, protein and biota stimulants, to ensure efficient rumen activity.

Due to the energy efficiency of **SH-PRL600**, sheep will be able to reduce their feed intake, and as a result reduce pressure placed on existing forage. Sheep metabolic requirements will be fully met, maintaining sound body condition and health while removing any pending issues with future conception and reproduction.

PFMA realises grazing conditions vary across Australia's pastoral lands. Talk to us today about how our practical feeding programs can aid your farming and help you navigate through difficult weather patterns.

We address:

- Supplementary range feeding
- Confinement feeding with supplements and roughage for maintaining body condition and livestock health and preserving range ground cover.

Rely on PFMA for your farming solutions.
