

PFMA Plus Advanced Sheep & Lamb feed Concentrates

To meet the challenges of an unpredictable climate, producers need to be clear minded and objective about how to remedy prevailing factors that impact on optimum farm animal production.

Livestock production falls when pasture nutrient levels decrease due to reduced rainfall and rising temperatures. Whether the focus is on wool growing and flock replacement reproduction or the production of prime lambs, a containment feeding program for the ewes or an intensive lamb finishing program, will ensure continual production.

PFMA has the knowledge and understanding to achieve optimum farm animal production. Our advanced nutritional feed concentrates are highly effective products that will assist the producer to achieve their desired targets.

PFMA Plus full feed concentrates incorporate proven advanced feed technologies. They have been specifically formulated to balance with grains and protein to provide all the highly digestible and absorbable nutrients livestock require for varying stages of physical growth and production.

Animal production strategies: Drought conditions demand thought and innovation. In today's current climate, the need to do things differently becomes incredibly apparent; but by carefully implementing advanced feed technologies to work for you, there is no need to lose vital animal production.

Breeding ewes: For managing ewes to maintain good health and vigour, during very dry conditions and when feeding in confined areas, with a viable body condition score (BSC) of approximately 55 - 60 % of the potential body weight - to ensure breeding ewes are fertile and have sound foetal growth during pregnancy to parturition.

- **PFMA Plus Sheep feed concentrate SH 612:** When mixed with roughage and/or, some grain will provide a TMR containing all the vitamins and minerals with levels of absorbable energy and protein as necessary to maintain the ewes fertility and health at 2.75 – 3.25 BSC under controlled intake feeding.

Prime Lamb meat production: For feeding lambs to reach target market carcass weights, and to achieve optimum high lean meat yield under short term finishing programs.

- **PFMA Plus Lamb feed concentrate SH 614:** For intensive ad libitum feeding, and when mixed with recommended grains and protein, will produce a high density and digestible TMR, which has been specifically formulated to achieve greater feed efficiency and conversion: increasing daily live weight gains and producing high lean meat yields. **This will allow producers to quickly reach target carcass weights.**

Progressive producers understand and implement, the fundamental factors that lead to profitable livestock operations: Genetics - Nutrition - Husbandry.

Talk to us today about how our advanced ruminant feed concentrates will enhance your livestock production.

PFMA (Prime Feed Materials Australia) Pty. Ltd.

P.O Box 137, Brighton VIC 3186

Tele: 61 3 9592 6077

Liability: PFMA Plus products – containing options of complex mineralised, vitamin, protein, medicated and energy enriched ruminant feed concentrates (the product/s) have been professionally formulated and blended together using quality ingredients under a quality endorsed manufacturing process and the product/s should only be used in accordance with feeding/mixing rates as shown on the products label.

The use of the product/s being beyond the control of the seller/manufacturer; no liability, warranties, statutory or otherwise expressed or implied, and no responsibility will be accepted for any damage or losses whatsoever arising from its application or usage.
